DRAGONFLY IT

QUICK START GUIDE

Dragonfly IT NetScan

What this is

A portable network discovery tool. Plug in, run it, get a professional PDF report of what's on a network — no installation required.

Before you scan

Only run this on a network you own or have explicit permission to assess. The tool will ask you to confirm this before it does anything.

How to run it

1. Copy DragonflyIT-NetScan.exe to a USB stick (or run it directly).
2. Double-click DragonflyIT-NetScan.exe.
3. Type YES when prompted to confirm you have authorisation to scan.
4. Enter the client or site name — this becomes the report title and filename.
5. Confirm or override the auto-detected subnet.
6. Wait while it scans — a few minutes on a typical office network.
7. The PDF report opens automatically and is saved next to the exe.

Reading the report

Devices found — total live hosts found on the subnet.
Risk levels — green/none: no notable exposure found. Amber/medium: worth a look (e.g. SMB, RDP, legacy NetBIOS exposed). Red/high: should be addressed soon (e.g. Telnet, VNC, unauthenticated services).
Findings section — a plain-English explanation of each flagged item.

Requirements

Windows 10 or 11 · no installation, no admin rights, no drivers needed · works entirely offline — nothing is sent anywhere.
